Project Zelula - SCRUM plan #3

Group 5/E:
Felix Akkermans
Niels Doekemeijer
Thomas van Helden
Albert ten Napel
Jan Pieter Waagmeester

May 21, 2012

1   Introduction

In this SCRUM plan we define the tasks we want to complete in this sprint. Every task is assigned to one or two developers and an estimate is provided for the effort required.

For each SCRUM run a milestone is created at GitHub, with issues for the tasks selected. The issues for this milestone can be found on: https://github.com/FelixAkk/synthbio/issues?milestone=10.

2   Selection and assignment of tasks

This is the third sprint of our project. During this sprint we will implement validation, evaluation and simulation of a circuit. We will also look at saving and loading a circuit. If all goes according to plan we can start reusing previously build circuits and simulate the outcome of a circuit. If we do this it means we have the product we planned implementing at the beginning of this project. Afterwards it will only be fine tuning.

Available time

The time available is four mornings in two weeks by five people. That's about sixteen hours per person.Including meetings we come to an estimate of 70 hours of actual working. However, this is below the amount of hours spend with respect to ECTS, so we will plan spend a little more.

A list of tasks, assignments and effort estimations is included in a table.

	Task	Developer	Effort	
			estimated	actual
#42	Client: Specify protein for wires by drop-down menu	Thomas	3	12
#44	Client: Specify input signals	Jan-Pieter	16	20
#22	Client: Circuit bookkeeping	Felix+Niels		..+15
#45	Client: Save Circuit	Felix+Niels	2*15	Actual
#46	Client: Load Circuit	Felix+Niels		..+4
#47	Server: Simulate Circuit	Albert	2	Actual
#48	Server: Convert circuit to simulator input	Albert	14	Actual
#49	Wiki: Simulator	Albert	1	Actual
-	Code Review	All	5*4	..+3
#50	Final Scrumplan-3	Thomas	2	Actual
#51	Scaffolding Scrumplan-4	Thomas	1	Actual
#52	Final report: Key Problems/Solutions	Thomas	4	Actual
	Total		93	

	Optional tasks[1]	Developer	estimated	actual
#43	Polishing modelling/grid styles and workflow	Felix+Niels	-	..+1
#53	Client: Output visualisation	-	-	Actual
#54	Client: Simulate Circuit	-	2	Actual
#55	Final report: Reflection on teamwork	-	-	Actual
	Total		>2	-

	Added during iteration	Developer	estimated	actual
-	JSLint ant target and style review.[2]	Jan Pieter	-	2
-	Client: validate Circuit[3]	Jan Pieter	-	2
	Total		-	4

	Grand Total			-

3 Reflection on this iteration

In this section we will give a quick review on this iteration.

3.1 Planning

We had planned to quite some work this iteration even though there was a holiday during this scrum run. We were requested to have a working program during the next sprint, so we looked at what was still missing and aimed to complete a great proportion of that during this sprint. We mainly shoved the Circuit Simulation on the client side to the next scrum run. The rest of the big chunks we tried to tackle this iteration. We also had a little bit of work left from the previous sprint so we planned that in as well.

---

[1] Things from next iterations that could be done if sufficient time is available

[2] To ensure some best practices in our JavaScript code, including coding style, we use JSLint/JSHint

[3] For some reason, this task was not in the initial scrum plan #3, but it was an optional task in #2.

We acknowledged that our final report will be a big piece of work as well, so we decided to work a little bit in advance on that.

3.2   Implementation

During the implementation of all of our functions we encountered some difficulties. Going through our task list we had some issues while implementing the dropdown menu for proteins. We didn't expect this but it seems jsPlumb combined with bootstrap can give quite some errors. We are still working on this. We tried a workaround, building a selectable dropdown menu from a regular list as well as putting a select menu on a wire. Both do not fully function.

Other issues will come here....
